

**NAME**

ppmtomap - extract all colors from a portable pixmap

**DESCRIPTION**

This program exists only for backward compatibility.

Use **pnmcolormap**, which replaced it in January 2002.

One trivial difference between **ppmtomap** and **pnmcolormap all** is that if the input is PBM or PGM, **ppmtomap** would produce PPM output, whereas **pnmcolormap all** produces the same kind of output as the input. This should not be very noticeable, though, as PBM and PGM images are usually usable anywhere a PPM image is.
