

NAME

pcap_major_version, pcap_minor_version – get the version number of a savefile

SYNOPSIS

```
#include <pcap/pcap.h>
```

```
int pcap_major_version(pcap_t *p);
```

```
int pcap_minor_version(pcap_t *p);
```

DESCRIPTION

If *p* refers to a “savefile”, **pcap_major_version()** returns the major number of the file format of the “savefile” and **pcap_minor_version()** returns the minor number of the file format of the “savefile”. The version number is stored in the “savefile”; note that the meaning of its values depends on the type of “savefile” (for example, pcap or pcapng).

If *p* refers to a live capture, the values returned by **pcap_major_version()** and **pcap_minor_version()** are not meaningful.
