

NAME

hpmount — change directory on an HFS+ volume

SYNOPSIS

hpmount [-r] [-pn] *source-path*

Description

hpmount introduces a new HFS+ volume. The source path may specify a block device or a regular file containing an HFS+ volume image. Furthermore, **hpmount** creates the file **.hfsplusvolume** in the user's home directory, where the source path and the catalogue ID of the current working directory are stored.

hpmount accepts the following options:

- r** mount the volume read-only. The default is to allow write-access.
- pn** mount partition number **n**. The default is to mount the first partition that looks like it contains an HFS+ volume.
