

NAME

isfdtype – test file type of a file descriptor

LIBRARY

Standard C library (*libc*, *-lc*)

SYNOPSIS

```
#include <sys/stat.h>
#include <sys/socket.h>

int isfdtype(int fd, int fdtype);
```

Feature Test Macro Requirements for glibc (see **feature_test_macros(7)**):

```
isfdtype():
    Since glibc 2.20:
        _DEFAULT_SOURCE
    Before glibc 2.20:
        _BSD_SOURCE || _SVID_SOURCE
```

DESCRIPTION

The **isfdtype()** function tests whether the file descriptor *fd* refers to a file of type *fdtype*. The *fdtype* argument specifies one of the **S_IF*** constants defined in *<sys/stat.h>* and documented in **stat(2)** (e.g., **S_IFREG**).

RETURN VALUE

The **isfdtype()** function returns 1 if the file descriptor *fd* is of type *fdtype* and 0 if it is not. On failure, *-1* is returned and *errno* is set to indicate the error.

ERRORS

The **isfdtype()** function can fail with any of the same errors as **fstat(2)**.

STANDARDS

The **isfdtype()** function is not specified in any standard, but did appear in the draft POSIX.1g standard. It is present on OpenBSD and Tru64 UNIX (where the required header file in both cases is just *<sys/stat.h>*, as shown in the POSIX.1g draft), and possibly other systems.

NOTES

Portable applications should use **fstat(2)** instead.
