

**NAME**

**git-lfs-push** – Push queued large files to the Git LFS endpoint

**SYNOPSIS**

**git lfs push** *options remote* [*ref...*]

**git lfs push** *remote* [*ref...*]

**git lfs push** **—object-id** *remote* [*oid...*]

**DESCRIPTION**

Upload Git LFS files to the configured endpoint for the current Git remote. By default, it filters out objects that are already referenced by the local clone of the remote.

**OPTIONS**

**—dry-run**

Print the files that would be pushed, without actually pushing them.

**—all** This pushes all objects to the remote that are referenced by any commit reachable from the refs provided as arguments. If no refs are provided, then all refs are pushed.

**—object-id**

This pushes only the object OIDs listed at the end of the command, separated by spaces.

**SEE ALSO**

`git-lfs-pre-push(1)`.

Part of the `git-lfs(1)` suite.
