

NAME

sha384sum – compute and check SHA384 message digest

SYNOPSIS

sha384sum [*OPTION*]... [*FILE*]...

DESCRIPTION

Print or check SHA384 (384-bit) checksums.

With no *FILE*, or when *FILE* is –, read standard input.

-b, --binary

read in binary mode

-c, --check

read SHA384 sums from the *FILE*s and check them

--tag create a BSD-style checksum

-t, --text

read in text mode (default)

-z, --zero

end each output line with NUL, not newline, and disable file name escaping

The following five options are useful only when verifying checksums:

--ignore-missing

don't fail or report status for missing files

--quiet

don't print OK for each successfully verified file

--status

don't output anything, status code shows success

--strict

exit non-zero for improperly formatted checksum lines

-w, --warn

warn about improperly formatted checksum lines

--help display this help and exit

--version

output version information and exit

The sums are computed as described in FIPS–180–2. When checking, the input should be a former output of this program. The default mode is to print a line with checksum, a space, a character indicating input mode ('*' for binary, ' ' for text or where binary is insignificant), and name for each *FILE*.

Note: There is no difference between binary mode and text mode on GNU systems.
