

NAME

glxheads – exercise multiple GLX connections

SYNOPSIS

glxheads [*display ...*]

DESCRIPTION

The *glxheads* program will try to open GLX connections on multiple X displays as specified on the command-line. If a connection can be made it will try to create a direct GLX context (and fallback to using indirect contexts if that fails) and open a window displaying a spinning green triangle.

If no display names are specified, *glxheads* will default to opening a single local connection on display 0.

EXAMPLE

To open a local connection on display 0 and two remote connections to the hosts *mars* (display 0) and *venus* (display 1), run *glxheads* with the following command-line:

```
$ glxheads :0 mars:0 venus:1
```

AUTHOR

glxheads was written by Brian Paul <brian.paul@tungstengraphics.com>.
