

NAME

showrgb – display an rgb color-name database

SYNOPSIS

showrgb [*database*]

DESCRIPTION

The *showrgb* program reads an rgb color-name database from a text file and converts it back to source form, printing the result to standard output. The default database is the one that X was built with, and may be overridden on the command line. Specify the database name without the *.txt*, *.pag* or *.dir* suffix.

FILES

/usr/share/X11/rgb default database.
