

NAME

hprm — remove a file or directory on an HFS+ volume

SYNOPSIS

hprm [-R] [-f] *hfs-path*

Description

hprm removes the file or directory specified by **hfs-path**. Since write access to HFS+ volumes is still experimental, the program prints a warning message and prompts the user before writing anything to the file system.

hprm accepts the following options:

- R** recursively remove the contents of a directory.
- f** one day, this option will probably disable prompting. For the time being, prompting is always enabled.
