

NAME

drand48, erand48, lrand48, nrand48, mrand48, jrand48, srand48, seed48, lcong48 – generate uniformly distributed pseudo-random numbers

LIBRARY

Standard C library (*libc*, *-lc*)

SYNOPSIS

```
#include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);

long lrand48(void);
long nrand48(unsigned short xsubi[3]);

long mrand48(void);
long jrand48(unsigned short xsubi[3]);

void srand48(long seedval);
unsigned short *seed48(unsigned short seed16v[3]);
void lcong48(unsigned short param[7]);
```

Feature Test Macro Requirements for glibc (see **feature_test_macros(7)**):

All functions shown above:

```
_XOPEN_SOURCE
|| /* glibc >= 2.19: */ _DEFAULT_SOURCE
|| /* glibc <= 2.19: */ _SVID_SOURCE
```

DESCRIPTION

These functions generate pseudo-random numbers using the linear congruential algorithm and 48-bit integer arithmetic.

The **drand48()** and **erand48()** functions return nonnegative double-precision floating-point values uniformly distributed over the interval [0.0, 1.0).

The **lrnd48()** and **nrand48()** functions return nonnegative long integers uniformly distributed over the interval [0, 2³¹).

The **mrnd48()** and **jrand48()** functions return signed long integers uniformly distributed over the interval [−2³¹, 2³¹).

The **srand48()**, **seed48()**, and **lcong48()** functions are initialization functions, one of which should be called before using **drand48()**, **lrnd48()**, or **mrnd48()**. The functions **erand48()**, **nrand48()**, and **jrand48()** do not require an initialization function to be called first.

All the functions work by generating a sequence of 48-bit integers, X_i , according to the linear congruential formula:

$$X_{n+1} = (aX_n + c) \bmod m, \text{ where } n \geq 0$$

The parameter $m = 2^{48}$, hence 48-bit integer arithmetic is performed. Unless **lcong48()** is called, a and c are given by:

```
a = 0x5DEECE66D
c = 0xB
```

The value returned by any of the functions **drand48()**, **erand48()**, **lrnd48()**, **nrand48()**, **mrnd48()**, or **jrand48()** is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, is copied from the high-order bits of X_i and transformed into the returned value.

The functions **drand48()**, **lrnd48()**, and **mrnd48()** store the last 48-bit X_i generated in an internal buffer. The functions **erand48()**, **nrand48()**, and **jrand48()** require the calling program to provide storage for the successive X_i values in the array argument *xsubi*. The functions are initialized by placing the initial value

of X_i into the array before calling the function for the first time.

The initializer function **srand48()** sets the high order 32-bits of X_i to the argument *seedval*. The low order 16-bits are set to the arbitrary value 0x330E.

The initializer function **seed48()** sets the value of X_i to the 48-bit value specified in the array argument *seed16v*. The previous value of X_i is copied into an internal buffer and a pointer to this buffer is returned by **seed48()**.

The initialization function **lcong48()** allows the user to specify initial values for X_i , a , and c . Array argument elements *param*[0–2] specify X_i , *param*[3–5] specify a , and *param*[6] specifies c . After **lcong48()** has been called, a subsequent call to either **srand48()** or **seed48()** will restore the standard values of a and c .

ATTRIBUTES

For an explanation of the terms used in this section, see **attributes(7)**.

Interface	Attribute	Value
drand48() , erand48() , lrand48() , nrand48() , mrand48() , jrand48() , srand48() , seed48() , lcong48()	Thread safety	MT-Unsafe race:drand48

The above functions record global state information for the random number generator, so they are not thread-safe.

STANDARDS

POSIX.1-2001, POSIX.1-2008, SVr4.
