

NAME

PCRE2 - Perl-compatible regular expressions (revised API)

SYNOPSIS

```
#include <pcre2.h>

pcre2_convert_context *pcre2_convert_context_create(
    pcre2_general_context *gcontext);
```

DESCRIPTION

This function is part of an experimental set of pattern conversion functions. It creates and initializes a new convert context. If its argument is `NULL`, `malloc()` is used to get the necessary memory; otherwise the memory allocation function within the general context is used. The result is `NULL` if the memory could not be obtained.

The pattern conversion functions are described in the **pcre2convert** documentation.
