

NAME

Dpkg::Deps::Union – list of unrelated dependencies

DESCRIPTION

This class represents a list of relationships. It inherits from Dpkg::Deps::Multiple.

METHODS

`$dep->output([$fh])`

The output method uses “, ” to join the list of relationships.

`$dep->implies($other_dep)`

`$dep->get_evaluation($other_dep)`

These methods are not meaningful for this object and always return undef.

`$dep->simplify_deps($facts)`

The simplification is done to generate an union of all the relationships. It uses `$simple_dep->merge_union($other_dep)` to get its job done.

CHANGES**Version 1.00 (dpkg 1.15.6)**

Mark the module as public.
