

NAME

`nm-applet` – network monitor and control GUI applet

SYNOPSIS

`nm-applet` [*OPTIONS*]

DESCRIPTION

`nm-applet` is a GTK-based GUI applet to monitor network status and devices and to start and stop network connections managed by NetworkManager. *nm-applet* is normally started at login by the desktop session manager and does not need to be run manually. *nm-applet* conforms to the XDG System Tray specification and requires that the desktop environment provide a System Tray implementation in which the applet will be embedded.

SEE ALSO
