

**NAME**

getgid, getegid – get group identity

**LIBRARY**

Standard C library (*libc*, *-lc*)

**SYNOPSIS**

```
#include <unistd.h>
```

```
gid_t getgid(void);  
gid_t getegid(void);
```

**DESCRIPTION**

**getgid()** returns the real group ID of the calling process.

**getegid()** returns the effective group ID of the calling process.

**ERRORS**

These functions are always successful and never modify *errno*.

**STANDARDS**

POSIX.1-2001, POSIX.1-2008, 4.3BSD.

**NOTES**

The original Linux **getgid()** and **getegid()** system calls supported only 16-bit group IDs. Subsequently, Linux 2.4 added **getgid32()** and **getegid32()**, supporting 32-bit IDs. The glibc **getgid()** and **getegid()** wrapper functions transparently deal with the variations across kernel versions.

On Alpha, instead of a pair of **getgid()** and **getegid()** system calls, a single **getxgid()** system call is provided, which returns a pair of real and effective GIDs. The glibc **getgid()** and **getegid()** wrapper functions transparently deal with this. See **syscall(2)** for details regarding register mapping.
