

NAME

kvm-ok – determine if this system is capable of running hardware accelerated KVM virtual machines (ie, possesses Virtualization Technology)

DESCRIPTION

kvm-ok is a program that will determine if the locate system can host hardware accelerated KVM virtual machines.

The program will first determine if */proc/cpuinfo* contains the flags indicating that the CPU has the Virtualization Technology (VT) capability.

Next, it will check if the */dev/kvm* device exists.

If running as root, it will check your CPU's MSRs to see if VT is disabled in the BIOS.

In some failure cases, **kvm-ok** provides hints on how you might go about enabling KVM on a system where it is arbitrarily disabled.

If KVM can be used, this script will exit 0, otherwise it will exit non-zero.

SEE ALSO

kvm(1), **dmesg(1)**

FILES

/proc/cpuinfo, */dev/kvm*

BUGS

The disabled-by-bios check currently scans **dmesg(1)** for a message displayed by the kernel. This is not ideal, in that a long-running system will eventually roll the dmesg logs. The kernel should expose the disabled-by-bios flag in */proc/cpuinfo*.
