NAME

EVP_KDF−PBKDF1 − The PBKDF1 EVP_KDF implementation

DESCRIPTION

Support for computing the **PBKDF1** password-based KDF through the **EVP_KDF** API.

The EVP_KDF−PBKDF1 algorithm implements the PBKDF1 password-based key derivation function, as described in RFC 8018; it derives a key from a password using a salt and iteration count.

Identity

‘‘PBKDF1’’ is the name for this implementation; it can be used with the **EVP_KDF_fetch()** function.

Supported parameters

The supported parameters are:

‘‘pass’’ (**OSSL_KDF_PARAM_PASSWORD**) <octet string>
‘‘salt’’ (**OSSL_KDF_PARAM_SALT**) <octet string>
‘‘iter’’ (**OSSL_KDF_PARAM_ITER**) <unsigned integer>

This parameter has a default value of 0 and should be set.

‘‘properties’’ (**OSSL_KDF_PARAM_PROPERTIES**) <UTF8 string>
‘‘digest’’ (**OSSL_KDF_PARAM_DIGEST**) <UTF8 string>

These parameters work as described in ‘‘PARAMETERS’’ in **EVP_KDF** (3).

NOTES

A typical application of this algorithm is to derive keying material for an encryption algorithm from a password in the ‘‘pass’’, a salt in ‘‘salt’’, and an iteration count.

Increasing the ‘‘iter’’ parameter slows down the algorithm which makes it harder for an attacker to perform a brute force attack using a large number of candidate passwords.

No assumption is made regarding the given password; it is simply treated as a byte sequence.

CONFORMING TO

RFC 8018
