NAME

ppmtobmp - convert a portable pixmap into a BMP file

SYNOPSIS

ppmtobmp [-windows] [-os2] [-bpp=bits_per_pixel] [ppmfile]

DESCRIPTION

Reads a portable pixmap as input. Produces a Microsoft Windows or OS/2 BMP file as output.

OPTIONS

All options can be abbreviated to their shortest unique prefix and you can use a double dash in place of the single dash, GNU-style.

-windows

Tells the program to produce a Microsoft Windows BMP file. (This is the default.)

-os2 Tells the program to produce an OS/2 BMP file. (Before August 2000, this was the default).

-bpp This determines how many bits per pixel you want the BMP file to contain. Only 1, 4, 8, and 24 are possible. By default, **ppmtobmp** chooses the smallest number with which it can represent all the colors in the input image. If you specify a number too small to represent all the colors in the input image, **ppmtobmp** tells you and terminates. You can use **ppmquant** or **ppmdither** to reduce the number of colors in the image.

NOTES

To get a faithful reproduction of the input image, the maxval of the input image must be 255. If it is something else, **ppmtobmp** the colors in the BMP file may be slightly different from the colors in the input.

Windows icons are not BMP files. Use **ppmtowinicon** to create those.
