NPM-REBUILD(1) NPM-REBUILD(1)

## **NAME**

```
npm-rebuild - Rebuild a package
```

#### **Synopsis**

```
npm rebuild [[<@scope>/]<name>[@<version>] ...]
```

## **Description**

alias: rb

This command runs the **npm build** command on the matched folders. This is useful when you install a new version of node, and must recompile all your C++ addons with the new binary. It is also useful when installing with **--ignore-scripts** and **--no-bin-links**, to explicitly choose which packages to build and/or link bins.

If one or more package names (and optionally version ranges) are provided, then only packages with a name and version matching one of the specifiers will be rebuilt.

#### Configuration

<!-- AUTOGENERATED CONFIG DESCRIPTIONS START --> <!-- automatically generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

# global

Default: falseType: Boolean

Operates in "global" mode, so that packages are installed into the **prefix** folder instead of the current working directory. See npm help folders for more on the differences in behavior.

- packages are installed into the {prefix}/lib/node\_modules folder, instead of the current working directory.
- bin files are linked to {prefix}/bin
- man pages are linked to {prefix}/share/man

<!-- automatically generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

## bin-links

Default: trueType: Boolean

Tells npm to create symlinks (or .cmd shims on Windows) for package executables.

Set to false to have it not do this. This can be used to work around the fact that some file systems don't support symlinks, even on ostensibly Unix systems. <!-- automatically generated, do not edit manually ---> <!-- see lib/utils/config/definitions.js --->

## ignore-scripts

Default: false Type: Boolean

If true, npm does not run scripts specified in package.json files.

Note that commands explicitly intended to run a particular script, such as **npm start**, **npm stop**, **npm restart**, **npm test**, and **npm run–script** will still run their intended script if **ignore–scripts** is set, but they will *not* run any pre– or post–scripts. <!— automatically generated, do not edit manually —> <!— see lib/utils/config/definitions.js —>

NPM-REBUILD(1) NPM-REBUILD(1)

# workspace

- Default:
- Type: String (can be set multiple times)

Enable running a command in the context of the configured workspaces of the current project while filtering by running only the workspaces defined by this configuration option.

Valid values for the **workspace** config are either:

- · Workspace names
- Path to a workspace directory
- Path to a parent workspace directory (will result in selecting all workspaces within that folder)

When set for the **npm init** command, this may be set to the folder of a workspace which does not yet exist, to create the folder and set it up as a brand new workspace within the project.

This value is not exported to the environment for child processes. <!-- automatically generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

#### workspaces

- · Default: null
- Type: null or Boolean

Set to true to run the command in the context of all configured workspaces.

Explicitly setting this to false will cause commands like **install** to ignore workspaces altogether. When not set explicitly:

• Commands that operate on the **node\_modules** tree (install, update, etc.) will link workspaces into the **node\_modules** folder. – Commands that do other things (test, exec, publish, etc.) will operate on the root project, *unless* one or more workspaces are specified in the **workspace** config.

This value is not exported to the environment for child processes. <!--- automatically generated, do not edit manually --> <!--- see lib/utils/config/definitions.js -->

# include-workspace-root

- · Default: false
- · Type: Boolean

Include the workspace root when workspaces are enabled for a command.

When false, specifying individual workspaces via the **workspace** config, or all workspaces via the **workspaces** flag, will cause npm to operate only on the specified workspaces, and not on the root project. <!-- automatically generated, do not edit manually --> <!-- see lib/utils/config/definitions.js -->

<!-- AUTOGENERATED CONFIG DESCRIPTIONS END -->
