### **NAME**

```
lgamma, lgammaf, lgammal, lgamma_r, lgammaf_r, lgammal_r, signgam - log gamma function
```

#### **LIBRARY**

```
Math library (libm, -lm)
```

## **SYNOPSIS**

```
#include <math.h>
    double lgamma(double x);
    float lgammaf(float x);
    long double lgammal(long double x);
    double lgamma_r(double x, int *signp);
    float lgammaf_r(float x, int *signp);
    long double lgammal_r(long double x, int *signp);
    extern int signgam;
Feature Test Macro Requirements for glibc (see feature_test_macros(7)):
    lgamma():
      ISOC99 SOURCE || POSIX C SOURCE >= 200112L || XOPEN SOURCE
        || /* Since glibc 2.19: */ DEFAULT SOURCE
        || /* glibc <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
    lgammaf(), lgammal():
      _ISOC99_SOURCE || _POSIX_C_SOURCE >= 200112L
        || /* Since glibc 2.19: */ _DEFAULT_SOURCE
        || /* glibc <= 2.19: */ _BSD_SOURCE || _SVID_SOURCE
    lgamma_r(), lgammaf_r(), lgammal_r():
      /* Since glibc 2.19: */ DEFAULT SOURCE
        || /* glibc <= 2.19: */ BSD SOURCE || SVID SOURCE
    signgam:
      _XOPEN_SOURCE
        || /* Since glibc 2.19: */ _DEFAULT_SOURCE
```

### DESCRIPTION

For the definition of the Gamma function, see **tgamma**(3).

The **lgamma**(), **lgammaf**(), and **lgammal**() functions return the natural logarithm of the absolute value of the Gamma function. The sign of the Gamma function is returned in the external integer signgam declared in <math.h>. It is 1 when the Gamma function is positive or zero, -1 when it is negative.

Since using a constant location signgam is not thread-safe, the functions  $lgamma_r()$ ,  $lgammaf_r()$ , and  $lgammal_r()$  have been introduced; they return the sign via the argument signp.

# **RETURN VALUE**

On success, these functions return the natural logarithm of Gamma(x).

 $\parallel$  /\* glibc <= 2.19: \*/ \_BSD\_SOURCE  $\parallel$  \_SVID\_SOURCE

If x is a NaN, a NaN is returned.

If x is 1 or 2, +0 is returned.

If x is positive infinity or negative infinity, positive infinity is returned.

If x is a nonpositive integer, a pole error occurs, and the functions return +**HUGE\_VAL**, +**HUGE\_VALF**, or +**HUGE\_VALL**, respectively.

If the result overflows, a range error occurs, and the functions return HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL, respectively, with the correct mathematical sign.

## **ERRORS**

See **math\_error**(7) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Pole error: x is a nonpositive integer

*errno* is set to **ERANGE** (but see BUGS). A divide-by-zero floating-point exception (**FE\_DI-VBYZERO**) is raised.

Range error: result overflow

errno is set to ERANGE. An overflow floating-point exception (FE\_OVERFLOW) is raised.

## **STANDARDS**

The **lgamma**() functions are specified in C99, POSIX.1-2001, and POSIX.1-2008. *signgam* is specified in POSIX.1-2001 and POSIX.1-2008, but not in C99. The **lgamma\_r**() functions are nonstandard, but present on several other systems.

## **BUGS**

In glibc 2.9 and earlier, when a pole error occurs, *errno* is set to **EDOM**; instead of the POSIX-mandated **ERANGE**. Since glibc 2.10, glibc does the right thing.
