## **NAME**

epsffit - fit encapsulated PostScript file (EPSF) into constrained size

## **SYNOPSIS**

```
epsffit [ -c ] [ -r ] [ -a ] [ -m ] [ -s ] llx lly urx ury [ infile [ outfile ] ]
```

## DESCRIPTION

*Epsffit* fits an EPSF file (encapsulated PostScript) to a given bounding box. The coordinates of the box are given by (**llx,lly**) for the lower left, and (**urx,ury**) for the upper right, in PostScript units (points).

If no input or output files are specified, *epsffit* read from the standard input and writes to the standard output.

# **OPTIONS**

- **−c** Center the image in the given bounding box.
- **-r** Rotate the image by 90 degrees counter-clockwise.
- -a Adjust the aspect ratio to fit the bounding box. The default is to preserve the aspect ratio.
- -m Rotates the image to maximise the size if it would fit the specified bounding box better.
- -s Add a *showpage* at the end of the file to force the image to print.
