NAME

display - displays an image or image sequence on any X server.

SYNOPSIS

display-im6.q16 [options] input-file

OVERVIEW

The **display-im6.q16** program is a member of the ImageMagick-ims6.q16(1) suite of tools. Use it to display an image or image sequence on any X server.

For more information about the display command, point your browser to file:///usr/share/doc/image-magick-6-common/html/www/display.html (on debian system you may install the imagemagick-6 package) or https://www.imagemagick.org/script/display.php.

DESCRIPTION

Image Settings:

-alpha option on, activate, off, deactivate, set, opaque, copy

transparent, extract, background, or shape

-antialias remove pixel-aliasing

-authenticate value decrypt image with this password
 -backdrop
 -channel type
 apply option to select image channels

-colormap type Shared or Private

-colorspace type-comment stringalternate image colorspaceannotate image with comment

-compress type type of pixel compression when writing the image

-decipher filename convert cipher pixels to plain pixels

-deskew threshold straighten an image

-define format:option

define one or more image format options

-delay centiseconds display the next image after pausing

-density geometry horizontal and vertical density of the image

-depth value image depth

-display server
 -dispose method
 -dither method
 display image to this X server
 layer disposal method
 apply error diffusion to image

-endian type
 -equalize
 -filter type
 endianness (MSB or LSB) of the image
 perform histogram equalization to an image
 use this filter when resizing an image

-filter type use this filter when resizing an image -format "string" output formatted image characteristics

-fuzz distance colors within this distance are considered equal -geometry geometry preferred size and location of the Image window

-gravity type horizontal and vertical backdrop placement
-identify identify the format and characteristics of the image

-immutable displayed image cannot be modified
 -interlace type type of image interlacing scheme
 -interpolate method pixel color interpolation method

-label string assign a label to an image
 -limit type value pixel cache resource limit
 -loop iterations loop images then exit

-map type-mattedisplay image using this Standard Colormap-mattestore matte channel if the image has one

-monitor monitor progress

-page geometry
 -profile filename
 -quality value
 size and location of an image canvas
 add, delete, or apply an image profile
 JPEG/MIFF/PNG compression level

ImageMagick Date: 2009/01/10 01:00:00 1

```
suppress all warning messages
 -quiet
 -regard-warnings pay attention to warning messages
                      execute a command in an remote display process
 -remote command
 -repage geometry
                     size and location of an image canvas (operator)
 -respect-parentheses settings remain in effect until parenthesis boundary
 -sampling-factor geometry
              horizontal and vertical sampling factor
                   image scene range
 -scenes range
 -seed value
                  seed a new sequence of pseudo-random numbers
 -set property value set an image property
 -size geometry
                    width and height of image
 -support factor
                   resize support: > 1.0 is blurry, < 1.0 is sharp
 -texture filename name of texture to tile onto the image background
 -transparent-color color
              transparent color
 -treedepth value
                    color tree depth
 –update seconds
                     detect when image file is modified and redisplay
 -verbose
                  print detailed information about the image
 -visual type
                  display image using this visual type
 -virtual-pixel method
              virtual pixel access method
 -window id
                   display image to background of this window
                     exit program when this window id is destroyed
 -window-group id
 -write filename
                    write image to a file
Image Operators:
 -auto-orient
                  automatically orient image
 -border geometry
                     surround image with a border of color
               clip along the first path from the 8BIM profile
 -clip
 -clip-path id
                  clip along a named path from the 8BIM profile
 -colors value
                   preferred number of colors in the image
 -contrast
                 enhance or reduce the image contrast
 -crop geometry
                     preferred size and location of the cropped image
 -despeckle
                  reduce the speckles within an image
 -edge factor
                  apply a filter to detect edges in the image
 -enhance
                  apply a digital filter to enhance a noisy image
 -extract geometry extract area from image
               flip image in the vertical direction
 -flip
                flop image in the horizontal direction
 -flop
 -frame geometry
                     surround image with an ornamental border
 -gamma value
                     level of gamma correction
 -monochrome
                     transform image to black and white
 -negate
                 replace each pixel with its complementary color
 -normalize
                   transform image to span the full range of colors
 -raise value
                  lighten/darken image edges to create a 3-D effect
 -resample geometry change the resolution of an image
 -resize geometry
                    resize the image
 -roll geometry
                    roll an image vertically or horizontally
 -rotate degrees
                   apply Paeth rotation to the image
 -sample geometry
                      scale image with pixel sampling
 -segment value
                    segment an image
 -sharpen geometry sharpen the image
                strip image of all profiles and comments
 -strip
```

-quantize colorspace reduce colors in this colorspace

ImageMagick Date: 2009/01/10 01:00:00 2

- -threshold value threshold the image
- -thumbnail geometry create a thumbnail of the image
- -trim trim image edges

Image Sequence Operators:

-coalesce merge a sequence of images -flatten flatten a sequence of images

Miscellaneous Options:

-debug events display copious debugging information

-help print program options

-log format-list typeformat of debugging informationprint a list of supported option arguments

-version print version information

In addition to those listed above, you can specify these standard X resources as command line options: —background, —bordercolor, —borderwidth, —font, —foreground, —iconGeometry, —iconic, —mattecolor, —name, —shared-memory, —usePixmap, or —title.

By default, the image format of 'file' is determined by its magic number. To specify a particular image format, precede the filename with an image format name and a colon (i.e. ps:image) or specify the image type as the filename suffix (i.e. image.ps). Specify 'file' as '-' for standard input or output.

Buttons

- 1 press to map or unmap the Command widget
- 2 press and drag to magnify a region of an image
- 3 press to load an image from a visual image directory

NOTE

The display program defaults to the X screen resolution. To display vector formats at their intended size, override the default resolution:

display -density 72 drawing.svg
