NAME

git-credential-cache--daemon - Temporarily store user credentials in memory

SYNOPSIS

git credential-cache—daemon [--debug] <socket>

DESCRIPTION

Note

You probably don't want to invoke this command yourself; it is started automatically when you use **git-credential-cache**(1).

This command listens on the Unix domain socket specified by **<socket>** for **git-credential-cache** clients. Clients may store and retrieve credentials. Each credential is held for a timeout specified by the client; once no credentials are held, the daemon exits.

If the —**debug** option is specified, the daemon does not close its stderr stream, and may output extra diagnostics to it even after it has begun listening for clients.
