NAME

pgrep, pkill, pidwait - look up, signal, or wait for processes based on name and other attributes

SYNOPSIS

```
pgrep [options] pattern
pkill [options] pattern
pidwait [options] pattern
```

DESCRIPTION

pgrep looks through the currently running processes and lists the process IDs which match the selection criteria to stdout. All the criteria have to match. For example,

```
$ pgrep -u root sshd
```

will only list the processes called sshd AND owned by root. On the other hand,

```
$ pgrep -u root,daemon
```

will list the processes owned by root OR daemon.

pkill will send the specified signal (by default SIGTERM) to each process instead of listing them on std-

pidwait will wait for each process instead of listing them on stdout.

OPTIONS

-signal

--signal signal

Defines the signal to send to each matched process. Either the numeric or the symbolic signal name can be used. (**pkill** only.)

-c, --count

Suppress normal output; instead print a count of matching processes. When count does not match anything, e.g. returns zero, the command will return non-zero value. Note that for pkill and pidwait, the count is the number of matching processes, not the processes that were successfully signaled or waited for.

-d, --delimiter delimiter

Sets the string used to delimit each process ID in the output (by default a newline). (pgrep only.)

-e, --echo

Display name and PID of the process being killed. (pkill only.)

-f, --full

The *pattern* is normally only matched against the process name. When $-\mathbf{f}$ is set, the full command line is used.

$-\mathbf{g}$, $--\mathbf{pgroup}\ pgrp$,...

Only match processes in the process group IDs listed. Process group 0 is translated into **pgrep**'s, **pkill**'s, or **pidwait**'s own process group.

-G, **--group** *gid*,...

Only match processes whose real group ID is listed. Either the numerical or symbolical value may be used.

-i, --ignore-case

Match processes case-insensitively.

-l, --list-name

List the process name as well as the process ID. (pgrep only.)

-a, --list-full

List the full command line as well as the process ID. (pgrep only.)

-n, --newest

Select only the newest (most recently started) of the matching processes.

-o, --oldest

Select only the oldest (least recently started) of the matching processes.

-O, --older secs

Select processes older than secs.

-P, --parent ppid,...

Only match processes whose parent process ID is listed.

-s, **−-session** *sid*,...

Only match processes whose process session ID is listed. Session ID 0 is translated into **pgrep**'s, **pkill**'s, or **pidwait**'s own session ID.

-t, --terminal term,...

Only match processes whose controlling terminal is listed. The terminal name should be specified without the "/dev/" prefix.

-u, --euid euid,...

Only match processes whose effective user ID is listed. Either the numerical or symbolical value may be used.

-U, --uid uid,...

Only match processes whose real user ID is listed. Either the numerical or symbolical value may be used.

-v. --inverse

Negates the matching. This option is usually used in **pgrep**'s or **pidwait**'s context. In**pkill**'s context the short option is disabled to avoid accidental usage of the option.

-w, --lightweight

Shows all thread ids instead of pids in **pgrep**'s or **pidwait**'s context. In**pkill**'s context this option is disabled.

-x, --exact

Only match processes whose names (or command lines if $-\mathbf{f}$ is specified) **exactly** match the *pattern*.

-F, --pidfile file

Read *PID*s from *file*. This option is more useful for**pkill**or**pid wait** than **pgrep**.

-L, --logpidfile

Fail if pidfile (see $-\mathbf{F}$) not locked.

$-\mathbf{r}$, $--\mathbf{runstates}\ D$, R, S, Z, ...

Match only processes which match the process state.

--ns pid

Match processes that belong to the same namespaces. Required to run as root to match processes from other users. See —**nslist** for how to limit which namespaces to match.

--nslist name,...

Match only the provided namespaces. Available namespaces: ipc, mnt, net, pid, user,uts.

-q, --queue value

Use **sigqueue(3)** rather than **kill(2)** and the value argument is used to specify an integer to be sent with the signal. If the receiving process has installed a handler for this signal using the SA_SIG-INFO flag to **sigaction(2)**, then it can obtain this data via the si_value field of the siginfo_t structure.

-V, --version

Display version information and exit.

-h, --help

Display help and exit.

OPERANDS

pattern Specifies an Extended Regular Expression for matching against the process names or command lines.

EXAMPLES

Example 1: Find the process ID of the **named** daemon:

\$ pgrep -u root named

Example 2: Make **syslog** reread its configuration file:

\$ pkill -HUP syslogd

Example 3: Give detailed information on all **xterm** processes:

ps - fp (pgrep - d, -x xterm)

Example 4: Make all **chrome** processes run nicer:

\$ renice +4 \$(pgrep chrome)

EXIT STATUS

- One or more processes matched the criteria. For pkill and pidwait, one or more processes must also have been successfully signalled or waited for.
- 1 No processes matched or none of them could be signalled.
- 2 Syntax error in the command line.
- 3 Fatal error: out of memory etc.

NOTES

The process name used for matching is limited to the 15 characters present in the output of /proc/pid/stat. Use the **-f** option to match against the complete command line, /proc/pid/cmdline.

The running **pgrep**, **pkill**, or **pidwait** process will never report itself as a match.

BUGS

The options $-\mathbf{n}$ and $-\mathbf{o}$ and $-\mathbf{v}$ can not be combined. Let me know if you need to do this.

Defunct processes are reported.
