NAME

systemd-modules-load.service, systemd-modules-load – Load kernel modules at boot

SYNOPSIS

systemd−modules−load.service

/lib/systemd/systemd−modules−load

DESCRIPTION

systemd−modules−load.service is an early boot service that loads kernel modules. It reads static configuration from files in /usr/ and /etc/, but also runtime configuration from /run/ and the kernel command line (see below).

See **modules-load.d**(5) for information about the configuration format of this service and paths where configuration files can be created.

KERNEL COMMAND LINE

systemd−modules−load.service understands the following kernel command line parameters:

modules_load=, *rd.modules_load=*
Takes a comma−separated list of kernel modules to statically load during early boot. The option prefixed with "rd." is read by the initial RAM disk only.
