NAME

Dpkg::Build::Env – track build environment

DESCRIPTION

The Dpkg::Build::Env module is used by dpkg-buildflags to track the build environment variables being used and modified.

FUNCTIONS

set($varname, $value)

Update the build environment variable $varname with value $value. Record it as being accessed and modified.

get($varname)

Get the build environment variable $varname value. Record it as being accessed.

has($varname)

Return a boolean indicating whether the environment variable exists. Record it as being accessed.

@list = **list_accessed()**

Returns a list of all environment variables that have been accessed.

@list = **list_modified()**

Returns a list of all environment variables that have been modified.

CHANGES

Version 0.xx

This is a private module.
