NAME

humount – remove an HFS volume from the list of known volumes

SYNOPSIS

humount [*volume-name-or-path*]

DESCRIPTION

humount is used to forget about an HFS volume previously mounted with **hmount**. Either the volume's name or the UNIX path to the volume may be used to specify the volume. If no name or path is given, the current volume is assumed.

NOTES

It is not strictly necessary to use this command. It does not affect any physical volumes; it only updates the file named *.hcwd* in the user's home directory used to keep track of the currently known HFS volumes.

SEE ALSO

hfsutils(1), hmount(1)

FILES

$HOME/.hcwd
