NAME
> **git−lfs−pre−push** – Git pre−push hook implementation

SYNOPSIS
> **git lfs pre−push** *remote* [remoteurl]

DESCRIPTION
> Responds to Git pre−hook events. It reads the range of commits from STDIN, in the following format:

> <local−ref> SP <local−sha1> SP <remote−ref> SP <remote-sha1> \n

> It also takes the remote name and URL as arguments.

> If any of those Git objects are associated with Git LFS objects, those objects will be pushed to the Git LFS API.

> In the case of pushing a new branch, the list of Git objects will be all of the Git objects in this branch.

> In the case of deleting a branch, no attempts to push Git LFS objects will be made.

OPTIONS
> **GIT_LFS_SKIP_PUSH**
> > Do nothing on pre−push. For more, see: git−lfs−config(5).

SEE ALSO
> git−lfs−clean(1), git−lfs−push(1).

> Part of the git−lfs(1) suite.
