NAME
>   **git−lfs−post−commit** – Git post−commit hook implementation

SYNOPSIS
>   **git lfs post−commit**

DESCRIPTION
>   Responds to Git post−commit events. It makes sure that any files which are marked as lockable by **git lfs track** are read−only in the working copy, if not currently locked by the local user.
>
>   Where the **git lfs post−merge** command, which has a similar purpose, must examine all files in the working copy, **git lfs post−commit** can limit itself checking only those files which have changed in **HEAD**. It primarily handles newly added lockable files which have not yet been made read−only.

SEE ALSO
>   git−lfs−post−merge(1), git−lfs−track(1)
>
>   Part of the git−lfs(1) suite.
