NAME
catanh, catanhf, catanhl – complex arc tangents hyperbolic

LIBRARY
Math library (*libm*, *−lm*)

SYNOPSIS
#include <complex.h>

double complex catanh(double complex *z***);**
float complex catanhf(float complex *z***);**
long double complex catanhl(long double complex *z***);**

DESCRIPTION
These functions calculate the complex arc hyperbolic tangent of *z*. If *y = catanh(z)*, then *z = ctanh(y)*. The imaginary part of *y* is chosen in the interval [−pi/2,pi/2].

One has:

```
catanh(z) = 0.5 * (clog(1 + z) − clog(1 − z))
```

VERSIONS
These functions were added in glibc 2.1.

ATTRIBUTES
For an explanation of the terms used in this section, see **attributes**(7).

Interface	Attribute	Value
catanh(), **catanhf**(), **catanhl**()	Thread safety	MT-Safe

STANDARDS
C99, POSIX.1-2001, POSIX.1-2008.

EXAMPLES
```
/* Link with "−lm" */

#include <complex.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int
main(int argc, char *argv[])
{
    double complex z, c, f;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <real> <imag>\n", argv[0]);
        exit(EXIT_FAILURE);
    }

    z = atof(argv[1]) + atof(argv[2]) * I;

    c = catanh(z);
    printf("catanh() = %6.3f %6.3f*i\n", creal(c), cimag(c));

    f = 0.5 * (clog(1 + z) − clog(1 − z));
    printf("formula  = %6.3f %6.3f*i\n", creal(f), cimag(f));

    exit(EXIT_SUCCESS);
```

        }
