NAME
gtk4-launch – Launch an application

SYNOPSIS
gtk4–launch [OPTIONS...] <APPLICATION> [URI...]

DESCRIPTION
gtk4–launch launches an application using the given name. The application is started with proper startup notification on a default display, unless specified otherwise.

gtk4–launch takes at least one argument, the name of the application to launch. The name should match application desktop file name, as residing in the applications subdirectories of the XDG data directories, with or without the **.desktop** suffix.

If called with more than one argument, the rest of them besides the application name are considered URI locations and are passed as arguments to the launched application.

OPTIONS
−?, −h, −−help
  Print the command's help and exit.

−−version
  Print the command's version and exit.

ENVIRONMENT
Some environment variables affect the behavior of **gtk4–launch**:

XDG_DATA_HOME, XDG_DATA_DIRS
  The environment variables specifying the XDG data directories.
