NAME
setvtrgb − set the virtual terminal RGB colors

SYNOPSIS
setvtrgb [*options*] *vga*/*FILE*/−

DESCRIPTION
The *setvtrgb* command takes a single argument, either the string **vga** , or a path to a file containing the red, green, and blue colors to be used by the Linux virtual terminals.

If you use the **FILE** parameter, **FILE** should be exactly 3 lines of 16 comma-separated decimal values for RED, GREEN, and BLUE.

To seed a valid **FILE** :
        cat /sys/module/vt/parameters/default_{red,grn,blu} > FILE

And then edit the values in **FILE**

OPTIONS
−C, **−−console**=*DEV*
       the console device to be used;

−h, **−−help**
       Prints usage message and exits.

−V, **−−version**
       Prints version number and exists.
