NAME
> Dpkg::Changelog::Debian – parse Debian changelogs

DESCRIPTION
> This class represents a Debian changelog file as an array of changelog entries (Dpkg::Changelog::Entry::Debian). It implements the generic interface Dpkg::Changelog. Only methods specific to this implementation are described below, the rest are inherited.

> Dpkg::Changelog::Debian parses Debian changelogs as described in **deb−changelog** (5).

> The parser tries to ignore most cruft like # or /* */ style comments, RCS keywords, Vim modelines, Emacs local variables and stuff from older changelogs with other formats at the end of the file. NOTE: most of these are ignored silently currently, there is no parser error issued for them. This should become configurable in the future.

METHODS
> `$count = $c−>parse($fh, $description)`
>> Read the filehandle and parse a Debian changelog in it, to store the entries as an array of Dpkg::Changelog::Entry::Debian objects. Any previous entries in the object are reset before parsing new data.

>> Returns the number of changelog entries that have been parsed with success.

CHANGES
> **Version 1.00 (dpkg 1.15.6)**
>> Mark the module as public.
