NAME
    qemu−debootstrap – QEMU debootstrap wrapper

SYNOPSIS
    qemu−debootstrap [*options*]

DESCRIPTION
    The **qemu−debootstrap** wrapper calls **debootstrap**(8) making use of the −−foreign and −−second-stage
    options, and copies the appropriate **qemu−user−static**(1) binary into place in order to install cross-archi-
    tecture chroots. In order for it to work seamlessly, the binfmt-support package must be installed.

SEE ALSO
    debootstrap(8), **qemu−user−static**(1).
