NAME

xfs_rtcp – XFS realtime copy command

SYNOPSIS

xfs_rtcp [**−e** *extsize*] [**-p**] *source ... target*

xfs_rtcp −V

DESCRIPTION

xfs_rtcp copies a file to the realtime partition on an XFS filesystem. If there is more than one *source* and *target*, the final argument (the *target*) must be a directory which already exists.

OPTIONS

−e *extsize*

Sets the extent size of the destination realtime file.

−p   Use if the size of the source file is not an even multiple of the block size of the destination filesystem. When **−p** is specified **xfs_rtcp** will pad the destination file to a size which is an even multiple of the filesystem block size. This is necessary since the realtime file is created using direct I/O and the minimum I/O is the filesystem block size.

−V   Prints the version number and exits.

SEE ALSO

xfs(5), **mkfs.xfs**(8), **mount**(8).

CAVEATS

Currently, realtime partitions are not supported under the Linux version of XFS, and use of a realtime partition **WILL CAUSE CORRUPTION** on the data partition. As such, this command is made available for curious **DEVELOPERS ONLY** at this point in time.
