NAME
       glib-gettextize − gettext internationalization utility

SYNOPSIS
       glib−gettextize [OPTION...] [DIRECTORY]

DESCRIPTION
       glib−gettextize helps to prepare a source package for being internationalized through gettext. It is a variant
       of the **gettextize** that ships with gettext.

       glib−gettextize differs from **gettextize** in that it doesn't create an intl/ subdirectory and doesn't modify
       po/ChangeLog (note that newer versions of **gettextize** behave like this when called with the
       −−no−changelog option).

OPTIONS
       −−help
           print help and exit

       −−version
           print version information and exit

       −c, **−−copy**
           copy files instead of making symlinks

       −f, **−−force**
           force writing of new files even if old ones exist

SEE ALSO
       gettextize(1)
