NAME

dh_bash−completion − install bash completions for package

SYNOPSIS

dh_bash−completion [*debhelper options*]

DESCRIPTION

dh_bash−completion is a debhelper program that is responsible for installing completions for bash, usable installing the ''bash-completion'' package.

If a file named debian/package.bash−completion exists, then different actions are performed, depending on its format.

It can be a proper completion snippet, and in that case it would be installed in the completion directory, and no other actions would be performed.

It can also be a list of files, with an optionally specified name to call the completion snippet after. The file format is as follows:

```
my/path/to/foo-completion        # this would be installed as "foo-completion"
my/path/to/bar-completion  baz  # this would be installed as "baz"
```
