NAME

projects − persistent project root definition

DESCRIPTION

The */etc/projects* file provides a mapping between numeric project identifiers and those directories which are the roots of the quota tree. Its format is simply:

```
# comments are hash-prefixed
# ...
10:/export/cage
42:/var/log
```

The */etc/projects* file is optional, instead **xfs_quota**(8) can be used with the **−p** argument to specify a project root directly for each operation.

SEE ALSO

xfs_quota(8), **xfsctl**(3), **projid**(5).
