NAME
       arptables-save – dump arptables rules to stdout (nft-based)

SYNOPSIS
       arptables−save [**−M** *modprobe*] [**−c**]

       arptables−save [**−V**]

DESCRIPTION
       arptables-save is used to dump the contents of an ARP Table in easily parseable format to STDOUT. Use
       I/O-redirection provided by your shell to write to a file.

       −M, **−−modprobe** *modprobe_program*
              Specify the path to the modprobe program. By default, arptables-save will inspect /proc/sys/ker-
              nel/modprobe to determine the executable's path.

       −c, **−−counters**
              Include the current values of all packet and byte counters in the output.

       −V, **−−version**
              Print version information and exit.
