NAME

XtAppSetFallbackResources − set fallback resources

SYNTAX

#include <X11/Intrinsic.h>

void XtAppSetFallbackResources(XtAppContext *app_context*, String* *specification_list*);

ARGUMENTS

app_context　　　　Specifies the application context.

specification_list

Specifies a NULL-terminated list of resource specifications to pre-load the database, or NULL.

DESCRIPTION

Each entry in *specification_list* points to a string in the format **XrmPutLineResource**. following a call to **XtAppSetFallbackResources**, when a resource database is being created for a particular screen and the Intrinsics are not able to find or read an application-specific class resource file and if *specification_list* is not NULL the resource specification in *specification_list* will be merged into the screen resource database in place of the application-specific class resource file. **XtAppSetFallbackResources** is not required to copy *specification_list*; the caller must ensure that the contents of the list and the strings addressed by the list remain valid until all displays are initialized or until **XtAppSetFallbackResources** is called again. The value NULL for *specification_list* removes any previous fallback resource specification for the application context. The intended use for fallback resources is to provide a minimal number of resources that will make the application usable (or at least terminate with helpful diagnostic messages) when some problem exists in finding and loading the application defaults file.
