NAME
>   **git−lfs−uninstall** – Remove Git LFS configuration

SYNOPSIS
>   **git lfs uninstall**

DESCRIPTION
>   Perform the following actions to remove the Git LFS configuration:
>
>   ○   Remove the "lfs" clean and smudge filters from the global Git config.
>
>   ○   Uninstall the Git LFS pre−push hook if run from inside a Git repository.

OPTIONS
>   −−local   Removes the "lfs" smudge and clean filters from the local repository's git config, instead of the global git config (˜/.gitconfig).
>
>   −−worktree
>   >   Removes the "lfs" smudge and clean filters from the current working tree's git config, instead of the global git config (˜/.gitconfig) or local repository's git config ($GIT_DIR/config). If multiple working trees are in use, the Git config extension **worktreeConfig** must be enabled to use this option. If only one working tree is in use, −−**worktree** has the same effect as −−**local**. This option is only available if the installed Git version is at least 2.20.0 and therefore supports the "worktreeConfig" extension.
>
>   −−system
>   >   Removes the "lfs" smudge and clean filters from the system git config, instead of the global git config (˜/.gitconfig).
>
>   −−skip−repo
>   >   Skips cleanup of the local repo; use if you want to uninstall the global lfs filters but not make changes to the current repo.

SEE ALSO
>   git−lfs−install(1), git−worktree(1).
>
>   Part of the git−lfs(1) suite.
