NAME

git−lfs−filter−process – Git filter process that converts between pointer and actual content

SYNOPSIS

git lfs filter−process git lfs filter−process −−skip

DESCRIPTION

Implement the Git process filter API, exchanging handshake messages and then accepting and responding to requests to either clean or smudge a file.

filter−process is always run by Git's filter process, and is configured by the repository's Git attributes.

The filter process uses Git's pkt−line protocol to communicate, and is documented in detail in gitattributes(5).

OPTIONS

Without any options, filter−process accepts and responds to requests normally.

−−skip   Skip automatic downloading of objects on clone or pull.

GIT_LFS_SKIP_SMUDGE
   Disables the smudging process. For more, see: git−lfs−config(5).

SEE ALSO

git−lfs−clean(1), git−lfs−install(1), git−lfs−smudge(1), gitattributes(5).

Part of the git−lfs(1) suite.
