NAME
> XML::XPath::Builder – SAX handler for building an XPath tree

SYNOPSIS
```
use AnySAXParser;
use XML::XPath::Builder;

$builder = XML::XPath::Builder->new();
$parser = AnySAXParser->new( Handler => $builder );

$root_node = $parser->parse( Source => [SOURCE] );
```

DESCRIPTION
> XML::XPath::Builder is a SAX handler for building an XML::XPath tree.

> XML::XPath::Builder is used by creating a new instance of XML::XPath::Builder and providing it as the Handler for a SAX parser. Calling 'parse()' on the SAX parser will return the root node of the tree built from that parse.
